Many questions remain about ways that people expanded, contracted, and invested in Beringian social networks especially during the socially and environmentally dynamic mid-late Holocene period. Prior ceramic research established that ceramic technology was part of Beringian information exchange networks over the last 1000 years, and that networks changed over time in relationship to shifting settlement patterns. New ceramic analysis is directed at understanding longer term patterns of cultural exchange between northwest Alaskans and the broader Beringian region over the last 2500 years.
