Development of a Mixed Gas Chemistry System for PFIB

Audrey Darus*, Erik J. Sánchez 2022 NSF/REU Program Department of Physics *Oregon State University Portland State University, Physics Department 1719 SW 10th Ave, Portland Oregon 97201

Focused Ion Beam: Gallium to Plasma

- A Focused Ion Beam (FIB) instrument allows a user to mill at micron & nano scale geometries, sputtering material to precise endpoints
 - Historically, the workhorse element has been gallium ion (Ga⁺)
- A Plasma Focused Ion Beam (PFIB) has similar use cases to Ga⁺ FIB, but uses elements such as Xenon to create an inductively coupled plasma of higher sputtering rates
 - Advantages of using PFIB over Ga⁺ FIB include, greater beam currents, increasing throughput by 4x, allowing for greater volumes of material to be removed

Fig 1. "PFIB-SEM vs. FIB-SEM", *Ellipsoidal mesoscale mineralization pattern in human cortical bone revealed in 3D by plasma focused ion beam serial sectioning*, Journal of structural biology. 212. 107615. 10.1016/j.jsb.2020.107615. Binkley, Dakota & Deering, Joseph & 'Yuan, Hui & Gourrier, Aurelien & Grandfield, Kathryn. (-2020).

Gas Manifold: Where are they used?

- A network for the transportation and mixing gasses through a central supply line
- Advantages are safe and cost-effective alternatives to manually adjusting single gas canisters
- Commonly used in the oil, medical, food processing, and semiconductor industries

Gas Manifold System

Experimental Objective: Ignite Deuterium (D₂) Gas

- Applications used to overcome difficulties igniting D₂ into a plasma
- Using a Wien filter (fig. 1) multiple gasses being supplied to the PFIB will allow for D₂ to ignite and create a plasma
- Allows user to filter ions by mass and energy
- By precisely mixing deuterium with another gas to create a plasma, a Wien filter will allow a user to select only D₂ to travel down the PFIB beam

Wien filter Diagram

Design Construction

- Hardware was connected using 1/4 igodolstainless steel tubing, Swagelok fittings and VCR fittings Both fittings ensure a vacuum seal and no leaks
- Ø

Swagelok Female Tube Fitting Connector

Parts

• Gas filter

- For removal of trace particles within the gas
- Mass flow controller
 - automatically controls gas flow
- Pneumatic actuator
 - Valves which open and shut to allow flow
- Baratron
 - Measures true pressure of system

MKS PDR-C-2C Power Supply Readout: Displays pressure coming from Baratron

MKS Type 247 4-Channel Readout: User interface to control gas flow rates and mixing ratios

Solenoid valves: direct air into pneumatic actuator to open or close flow

Mass Flow Controller

- A mass flow controller (MFC) uses sensors which detect the flow of gas and contain electronics which analyze flow rates and mix ratio between two or more gasses
- A MFC is important in a gas manifold system because it allows for greater precision of mixing gas with lower risks of leaks

Diagram of Mass Flow System with Mass Flow

Mass Flow Controller Schematic

Physical set up

MKS Model 247 4-Channel Readout

MKS PDR-C-2C Power Supply Readout

Front control panel: for manual operation

MKS Type 622 Baratron Capacitance Manometer

 The Baratron works by comparing a reference pressure against true pressure, by measuring deflection of a thin metal diaphragm

Baratron connection to line: Process

with tube connections

Now able to attach to line with O-ring and clamp

Electrical Connections

- Device operator manuals \bullet contain information regarding compatible pin output configuration
- Physical connections are igodolcreated by soldering wires to device pins and testing with a multimeter

DB 15 pin-out diagram

Wire corrected for Baratron connection

Troubleshooting

- Often connection tables in manuals do not match up, it is up to the user to determine proper connections
- Dangers of connecting wires improperly include electrical shorts, device damage, or malfunctions

MFC to 4-Channel Readout Connections

Testing Wires and Readout Calibration

- Tubing from an Argon gas tank led to a needle valve and an MFC with a flow meter following the MFC.
- The flowmeter has a scale of 0.1-1.0 standard cubic feet per hour (SCFH). The maximum flow rate for the MFC is 200 standard cubic centimeters per minute (SCCM)
- Gas flow in series ensures there will be an identical flow rate throughout the entire system
- When the flowmeter reads 0.42 SCFH, a 4channel readout can be calibrated to show an equivalent value of 200 SCCM

6.0 6.0 6.0 6.0

Ar gas flowing in series through valve, MFC, and flowmeter

Next steps

- Connect solenoid valves to pneumatic actuators with tubing for testing with a DC power supply
- Test the connection between the Baratron and its PDR-C-2C readout
- Integrate manifold system into 19" rack to connect to vacuum pump and PFIB
- Create a graphical user interface (GUI) to allow for valves to be switched on and off by way of software

Acknowledgment

Thank you to Abdul Almutairi and Nathan Davis for their help on this project

The Author's participation in this project was supported by the National Science Foundation's Application of Microscopy and Microanalysis in Multidisciplinary Research REU program at Portland State University under grant #1851851.

Thank you for listening
