It takes a village to restore our stream banks.

Installing plants to restore stream banks helps keep storm water runoff from polluting our waterways. And that’s just what 27,000 Community Watershed Stewardship Program volunteers have done to restore 50 acres of our region’s watersheds. For Professor Barry Messer, who leads the program in partnership with the City of Portland, this kind of community-based learning cultivates healthy environments as well as a sense of civic responsibility for students, community members, and the University itself.
